About Your System

This section describes the physical, firmware, and software interface features that provide and ensure the essential functioning of your system. The physical connectors on your system's front and back panels provide convenient connectivity and system expansion capability. The system firmware, applications, and operating systems monitor the system and component status and alert you when a problem arises. System conditions can be reported by any of the following:

- Front or back panel indicators
- LCD status messages
- System messages
- Warning messages
- Diagnostics messages
- Alert messages

This section describes each type of message, lists the possible causes, and provides steps to resolve any problems indicated by a message. The system indicators and features are illustrated in this section.

Other Information You May Need

 **CAUTION:** The *Product Information Guide* provides important safety and regulatory information. Warranty information may be included within this document or as a separate document.

- The *Rack Installation Guide* or *Rack Installation Instructions* included with your rack solution describes how to install your system into a rack.
- The *Getting Started Guide* provides an overview of system features, setting up your system, and technical specifications.
- CDs included with your system provide documentation and tools for configuring and managing your system.
- Systems management software documentation describes the features, requirements, installation, and basic operation of the software.
- Operating system documentation describes how to install (if necessary), configure, and use the operating system software.
- Documentation for any components you purchased separately provides information to configure and install these options.

- Updates are sometimes included with the system to describe changes to the system, software, and/or documentation.

 **NOTE:** Always check for updates on support.dell.com and read the updates first because they often supersede information in other documents.

- Release notes or readme files may be included to provide last-minute updates to the system or documentation or advanced technical reference material intended for experienced users or technicians.

Accessing System Features During Startup

Table 1-1 describes keystrokes that may be entered during startup to access system features. If your operating system begins to load before you enter the keystroke, allow the system to finish booting, and then restart your system and try again.

Table 1-1. Keystrokes for Accessing System Features

Keystroke	Description
<F2>	Enters the System Setup program. See "Using the System Setup Program" on page 33.
<F10>	Enters the System Diagnostics program. See "Running the System Diagnostics" on page 112.
<Ctrl+E>	Enters the Baseboard Management Controller (BMC) Management Utility, which allows access to the system event log (SEL). See the <i>BMC User's Guide</i> for more information on setup and use of BMC.
<Ctrl+C>	Enters the SAS Configuration Utility. See your SAS adapter <i>User's Guide</i> for more information.
<Ctrl+R>	Enters the RAID configuration utility, which allows you to configure an optional RAID card. For more information, see the documentation for your RAID card.
<Ctrl+S>	Option is displayed only if you have PXE support enabled through the System Setup Program (see "Integrated Devices Screen" on page 38). This keystroke allows you to configure NIC settings for PXE boot. For more information, see the documentation for your integrated NIC.
<Ctrl+D>	If you have the optional Dell Remote Access Controller (DRAC) installed, this keystroke allows access to selected DRAC configuration settings. See the <i>DRAC User's Guide</i> for more information on setup and use of DRAC.

Front-Panel Features and Indicators

Figure 1-1 shows the controls, indicators, and connectors located behind the optional rack bezel on the system's front panel.

Figure 1-1. Front-Panel Features and Indicators

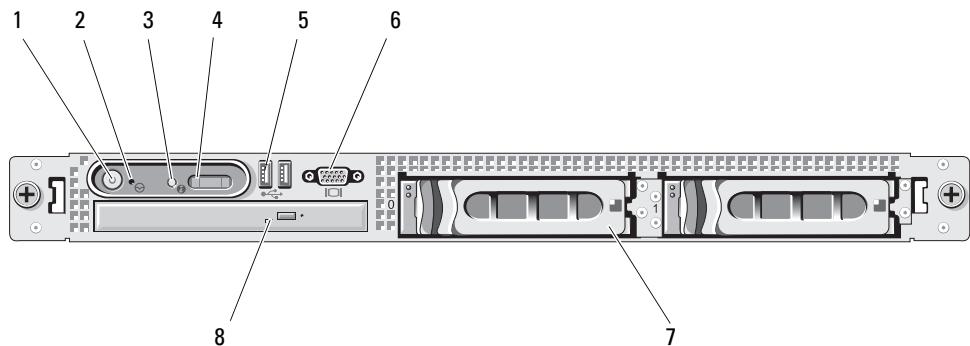

Table 1-2. Front-Panel LED Indicators, Buttons, and Connectors

Item	Indicator, Button, or Connector	Icon	Description
1	Power-on indicator, power button		<p>The power button controls the DC power supply output to the system.</p> <p>NOTE: If you turn off the system using the power button and the system is running an ACPI-compliant operating system, the system performs a graceful shutdown before the power is turned off. If the system is not running an ACPI-compliant operating system, the power is turned off immediately after the power button is pressed.</p>
2	NMI button		<p>Used to troubleshoot software and device driver errors when using certain operating systems. This button can be pressed using the end of a paper clip.</p> <p>Use this button only if directed to do so by qualified support personnel or by the operating system's documentation.</p>
3	System identification button		<p>The identification buttons on the front and back panels can be used to locate a particular system within a rack. When one of these buttons is pushed, the blue system status indicator on the front and back blinks until one of the buttons is pushed again.</p>

Table 1-2. Front-Panel LED Indicators, Buttons, and Connectors (continued)

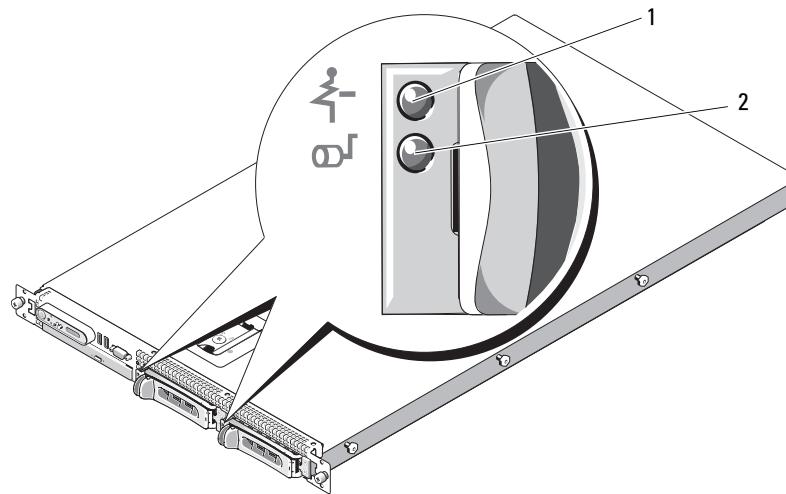

Item	Indicator, Button, or Connector	Icon	Description
4	LCD display		Provides system ID, status information, and system error messages. The LCD display lights during normal system operation. Both the systems management software and the identification buttons located on the front and back of the system can cause the LCD to flash blue to identify a particular system. The LCD display lights amber when the system needs attention due to a problem with power supplies, fans, system temperature, or hard drives. NOTE: If the system is connected to AC power and an error has been detected, the LCD display lights amber regardless of whether the system has been powered on.
5	USB connectors (2)		Connects USB 2.0-compliant devices to the system.
6	Video connector		Connects a monitor to the system.
7	Hard drives (optional)		Four 2.5" drives or two 3.5" drives (shown in figure).
8	Optical drive (optional)		One optional slimline optical drive

NOTE: DVD devices are data only.

Hard-Drive Indicator Codes

If your hard drives are configured with the optional SAS RAID daughter card, two indicators on each of the hard-drive carriers provide information on the status of the hard drives. See Figure 1-2 and Table 1-3. The SAS backplane firmware controls the drive power-on/fault indicator.

Figure 1-2. Hard-Drive Indicators

1 drive-status indicator (green and amber)
2 green drive-activity indicator

Table 1-3 lists the drive indicator patterns. Different patterns are displayed as drive events occur in the system. For example, if a hard-drive fails, the "drive failed" pattern appears. After the drive is selected for removal, the "drive being prepared for removal" pattern appears, followed by the "drive ready for insertion or removal" pattern. After the replacement drive is installed, the "drive being prepared for operation" pattern appears, followed by the "drive online" pattern.

 **NOTE:** For non-RAID configurations, only the drive-activity indicator is active. The drive-status indicator is off.

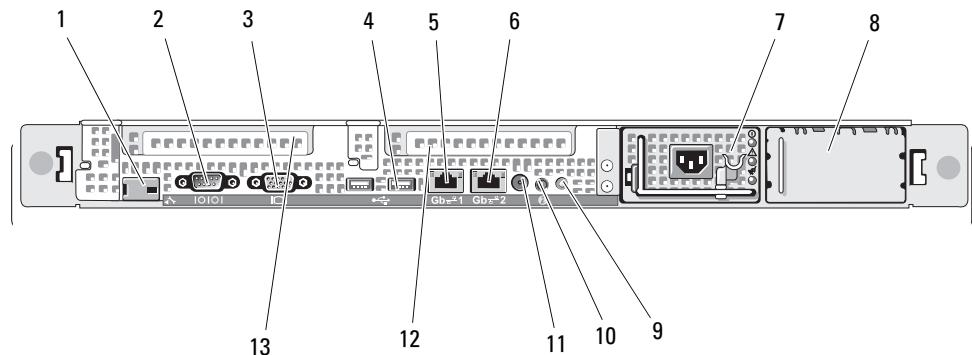

Table 1-3. Hard-Drive Indicator Patterns for RAID

Condition	Drive-Status Indicator Pattern
Identify drive/preparing for removal	Blinks green two times per second.
Drive ready for insertion or removal	Off
Drive predicted failure	Blinks green, amber, and off.
Drive failed	Blinks amber four times per second.
Drive rebuilding	Blinks green slowly.
Drive online	Steady green.
Rebuild aborted	Blinks green three seconds, amber three seconds, and off six seconds.

Back-Panel Features and Indicators

Figure 1-3 shows the controls, indicators, and connectors located on the system's back panel.

Figure 1-3. Back-Panel Features and Indicators

10	system identification button	11	system status indicator connector	12	left PCI expansion slot (slot 2)
13	center PCI expansion slot (slot 1)				

Connecting External Devices

When connecting external devices to your system, follow these guidelines:

- Most devices must be connected to a specific connector and device drivers must be installed before the device operates properly. (Device drivers are normally included with your operating system software or with the device itself.) See the documentation that accompanied the device for specific installation and configuration instructions.
- Always attach external devices while your system is turned off. Next, turn on any external devices before turning on the system (unless the documentation for the device specifies otherwise).

For information about individual connectors, see "Jumpers and Connectors" on page 115. For information about enabling, disabling, and configuring I/O ports and connectors, see "Using the System Setup Program" on page 33.

Power Indicator Codes

The power button on the front panel controls the power input to the system's power supplies. The power indicator can provide information on power status (see Figure 1-1). Table 1-4 lists the power button indicator codes.

Table 1-4. Power Button Indicators

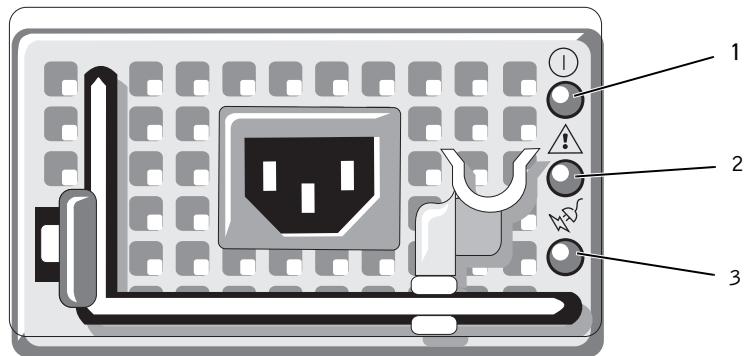

Indicator	Function
On	Indicates that power is supplied to the system and the system is operational.
Off	Indicates that no power is supplied to the system.

The indicators on the power supplies show whether power is present or whether a power fault has occurred (see Figure 1-4).

Table 1-5. Power Supply Indicators

Indicator	Function
Power supply status	Green indicates that the power supply is operational.
Power supply fault	Amber indicates a problem with the power supply.
AC line status	Green indicates that a valid AC source is connected to the power supply.

Figure 1-4. Power Supply Indicators

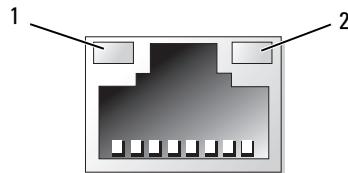

1 power supply status indicator 2 power supply fault indicator 3 AC line status indicator

NIC Indicator Codes

Each NIC on the back panel has an indicator that provides information on network activity and link status. See Figure 1-5. Table 1-6 lists the NIC indicator codes.

Figure 1-5. NIC Indicators

1 link indicator

2 activity indicator

Table 1-6. NIC Indicator Codes

Indicator	Indicator Code
Link and activity indicators are off	The NIC is not connected to the network.
Link indicator is green	The NIC is connected to a valid link partner on the network.
Activity indicator is amber blinking	Network data is being sent or received.

LCD Status Messages

The system's control panel LCD provides status messages to signify when the system is operating correctly or when the system needs attention.

The LCD lights blue to indicate a normal operating condition, and lights amber to indicate an error condition. The LCD scrolls a message that includes a status code followed by descriptive text. Table 1-7 lists the LCD status messages that can occur and the probable cause for each message. The LCD messages refer to events recorded in the System Event Log (SEL). For information on the SEL and configuring system management settings, see the systems management software documentation.

 **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

 **NOTE:** If your system fails to boot, press the System ID button for at least five seconds until an error code appears on the LCD. Record the code, then see "Getting Help" on page 125.

Solving Problems Described by LCD Status Messages

The code and text on the LCD can often specify a very precise fault condition that is easily corrected. For example, if the code E1418 CPU_1_Presence appears, you know that a microprocessor is not installed in socket 1.

In contrast, you might be able to determine the problem if multiple related errors occur. For example, if you receive a series of messages indicating multiple voltage faults, you might determine that the problem is a failing power supply.

Removing LCD Status Messages

For faults associated with sensors, such as temperature, voltage, fans, and so on, the LCD message is automatically removed when that sensor returns to a normal state. For example, if temperature for a component goes out of range, the LCD displays the fault; when the temperature returns to the acceptable range, the message is removed from the LCD. For other faults, you must take action to remove the message from the display:

- Clear the SEL — You can perform this task remotely, but you will lose the event history for the system.
- Power cycle — Turn off the system and disconnect it from the electrical outlet; wait approximately ten seconds, reconnect the power cable, and restart the system.

Any of these actions will remove fault messages, and return the status indicators and LCD colors to the normal state. Messages will reappear under the following conditions:

- The sensor returns to a normal state but fails again, resulting in a new SEL entry.
- The system is reset and new error events are detected.
- A failure is recorded from another source that maps to the same display entry.

System Messages

System messages appear on the screen to notify you of a possible problem with the system. Table 1-8 lists the system messages that can occur and the probable cause and corrective action for each message.

NOTE: If you receive a system message that is not listed in Table 1-8, check the documentation for the application that is running when the message appears or the operating system's documentation for an explanation of the message and recommended action.

CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

Warning Messages

A warning message alerts you to a possible problem and prompts you to respond before the system continues a task. For example, before you format a diskette, a message will warn you that you may lose all data on the diskette. Warning messages usually interrupt the task and require you to respond by typing y (yes) or n (no).

NOTE: Warning messages are generated by either the application or the operating system. For more information, see the documentation that accompanied the operating system or application.

Diagnostics Messages

When you run system diagnostics, an error message may result. Diagnostic error messages are not covered in this section. Record the message on a copy of the Diagnostics Checklist in "Getting Help" on page 125, and then follow the instructions in that section for obtaining technical assistance.

Alert Messages

Systems management software generates alert messages for your system. Alert messages include information, status, warning, and failure messages for drive, temperature, fan, and power conditions. For more information, see the systems management software documentation.

Using the System Setup Program

After you set up your system, run the System Setup program to familiarize yourself with your system configuration and optional settings. Record the information for future reference.

You can use the System Setup program to:

- Change the system configuration stored in NVRAM after you add, change, or remove hardware
- Set or change user-selectable options—for example, the time or date
- Enable or disable integrated devices
- Correct discrepancies between the installed hardware and configuration settings

Entering the System Setup Program

- 1 Turn on or restart your system.
- 2 Press **<F2>** immediately after you see the following message:

<F2> = System Setup

If your operating system begins to load before you press **<F2>**, allow the system to finish booting, and then restart your system and try again.

NOTE: To ensure an orderly system shutdown, see the documentation that accompanied your operating system.

Responding to Error Messages

You can enter the System Setup program by responding to certain error messages. If an error message appears while the system is booting, make a note of the message. Before entering the System Setup program, see "System Messages" on page 25 for an explanation of the message and suggestions for correcting errors.

NOTE: After installing a memory upgrade, it is normal for your system to send a message the first time you start your system.

System and Setup Password Features

 **NOTICE:** The password features provide a basic level of security for the data on your system. If your data requires more security, use additional forms of protection, such as data encryption programs.

 **NOTICE:** Anyone can access the data stored on your system if you leave the system running and unattended without having a system password assigned or if you leave your system unlocked so that someone can disable the password by changing a jumper setting.

Your system is shipped to you without the system password feature enabled. If system security is a concern, operate your system only with system password protection.

To change or delete an existing password, you must know the password (see "Deleting or Changing an Existing System Password" on page 42). If you forget your password, you cannot operate your system or change settings in the System Setup program until a trained service technician changes the password jumper setting to disable the passwords, and erases the existing passwords. This procedure is described in "Disabling a Forgotten Password" on page 117.

Using the System Password

After a system password is assigned, only those who know the password have full use of the system. When the **System Password** option is set to **Enabled**, the system prompts you for the system password after the system starts.

Assigning a System Password

Before you assign a system password, enter the System Setup program and check the **System Password** option.

When a system password is assigned, the setting shown for the **System Password** option is **Enabled**. If the setting shown for the **Password Status** is **Unlocked**, you can change the system password. If the **Password Status** option is **Locked**, you cannot change the system password. When the system password feature is disabled by a jumper setting, the system password is **Disabled**, and you cannot change or enter a new system password.

When a system password is not assigned and the password jumper on the system board is in the enabled (default) position, the setting shown for the **System Password** option is **Not Enabled** and the **Password Status** field is **Unlocked**. To assign a system password:

- 1 Verify that the **Password Status** option is set to **Unlocked**.
- 2 Highlight the **System Password** option and press <Enter>.
- 3 Type your new system password.

You can use up to 32 characters in your password.

As you press each character key (or the spacebar for a blank space), a placeholder appears in the field.

The password assignment is not case-sensitive. However, certain key combinations are not valid. To erase a character when entering your password, press <Backspace> or the left-arrow key.

 **NOTE:** To escape from the field without assigning a system password, press <Enter> to move to another field, or press <Esc> at any time prior to completing step 5.

- 4 Press <Enter>.
- 5 To confirm your password, type it a second time and press <Enter>.

The setting shown for the **System Password** changes to **Enabled**. Exit the System Setup program and begin using your system.

- 6 Either reboot your system now for your password protection to take effect or continue working.

 **NOTE:** Password protection does not take effect until you reboot the system.

Using Your System Password to Secure Your System

 **NOTE:** If you have assigned a setup password (see "Using the Setup Password" on page 42"), the system accepts your setup password as an alternate system password.

When the **Password Status** option is set to **Unlocked**, you have the option to leave the password security enabled or to disable the password security.

To leave the password security enabled:

- 1 Turn on or reboot your system by pressing <Ctrl><Alt>.
- 2 Type your password and press <Enter>.

To disable the password security:

- 1 Turn on or reboot your system by pressing <Ctrl><Alt>.
- 2 Type your password and press <Ctrl><Enter>.

When the **Password Status** option is set to **Locked** whenever you turn on your system or reboot your system by pressing **<Ctrl><Alt>**, type your password and press **<Enter>** at the prompt.

After you type the correct system password and press **<Enter>**, your system operates as usual.

If an incorrect system password is entered, the system displays a message and prompts you to re-enter your password. You have three attempts to enter the correct password. After the third unsuccessful attempt, the system displays an error message showing the number of unsuccessful attempts and that the system has halted and will shut down. This message can alert you to an unauthorized person attempting to use your system.

Even after you shut down and restart the system, the error message continues to be displayed until the correct password is entered.

 **NOTE:** You can use the **Password Status** option in conjunction with the **System Password** and **Setup Password** options to further protect your system from unauthorized changes.

Deleting or Changing an Existing System Password

- 1 When prompted, press **<Ctrl><Enter>** to disable the existing system password. If you are asked to enter your setup password, contact your network administrator.
- 2 Enter the System Setup program by pressing **<F2>** during POST.
- 3 Select the **System Security** screen field to verify that the **Password Status** option is set to **Unlocked**.
- 4 When prompted, type the system password.
- 5 Confirm that **Not Enabled** is displayed for the **System Password** option.

If **Not Enabled** is displayed for the **System Password** option, the system password has been deleted. If **Enabled** is displayed for the **System Password** option, press the **<Alt>** key combination to restart the system, and then repeat steps 2 through 5.

Using the Setup Password

Read the information in the following sections to assign or change your setup password.

Assigning a Setup Password

You can assign (or change) a setup password only when the **Setup Password** option is set to **Not Enabled**. To assign a setup password, highlight the **Setup Password** option and press the **<+>** or **<->** key. The system prompts you to enter and verify the password. If a character is illegal for password use, the system beeps.

 **NOTE:** The setup password can be the same as the system password. If the two passwords are different, the setup password can be used as an alternate system password. However, the system password cannot be used in place of the setup password.

You can use up to 32 characters in your password.

As you press each character key (or the spacebar for a blank space), a placeholder appears in the field.

The password assignment is not case-sensitive. However, certain key combinations are not valid. If you enter one of these combinations, the system beeps. To erase a character when entering your password, press <Backspace> or the left-arrow key.

After you verify the password, the **Setup Password** setting changes to **Enabled**. The next time you enter the System Setup program, the system prompts you for the setup password.

A change to the **Setup Password** option becomes effective immediately (restarting the system is not required).

Operating With a Setup Password Enabled

If **Setup Password** is set to **Enabled**, you must enter the correct setup password before you can modify most of the System Setup options. When you start the System Setup program, the program prompts you to enter a password.

If you do not enter the correct password in three attempts, the system lets you view, but not modify, the System Setup screens—with the following exception: If **System Password** is not set to **Enabled** and is not locked through the **Password Status** option, you can assign a system password (however, you cannot disable or change an existing system password).

 **NOTE:** You can use the **Password Status** option in conjunction with the **Setup Password** option to protect the system password from unauthorized changes.

Deleting or Changing an Existing Setup Password

- 1 Enter the System Setup program and select the **System Security** option.
- 2 Highlight the **Setup Password** option, press <Enter> to access the setup password window, and press <Enter> twice to clear the existing setup password.
The setting changes to **Not Enabled**.
- 3 If you want to assign a new setup password, perform the steps in "Assigning a Setup Password" on page 42.

Disabling a Forgotten Password

See "Disabling a Forgotten Password" on page 117.

Baseboard Management Controller Configuration

The Baseboard Management Controller (BMC) enables configuring, monitoring, and recovery of systems remotely. BMC provides the following features:

- Uses the system's integrated NIC
- Fault logging and SNMP alerting
- Access to system event log and sensor status
- Control of system functions including power on and off

- Support is independent of the system's power or operating state
- Provides text console redirection for system setup, text-based utilities, and operating system consoles

NOTE: To remotely access the BMC through the integrated NIC, you must connect the network connection to integrated NIC1.

For additional information on using BMC, see the documentation for the BMC and systems management applications.

Entering the BMC Setup Module

- 1 Turn on or restart your system.
- 2 Press **<Ctrl-E>** when prompted after POST.

If your operating system begins to load before you press **<Ctrl-E>**, allow the system to finish booting, and then restart your system and try again.

BMC Setup Module Options

For information about the BMC Setup Module options and how to configure the emergency management port (EMP), see the *BMC User's Guide*.

Inside the System

! **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

! **CAUTION:** The memory modules can become extremely hot during normal operation. Allow the modules sufficient time to cool before handling.

In Figure 3-1, the bezel, system cover, and memory cooling shroud are removed to provide an interior view of the system.

13	two 3.5-inch or four 2.5-inch hard drive bays	14	optical slimline drive (optional)		

The system board holds the system's control circuitry and other electronic components. Several hardware options, such as the microprocessors and memory, are installed directly on the system board. The left and center risers each have one slot and can accommodate up to two half-length PCI-X cards or two half-length PCIe expansion cards. For more information, see "Expansion Cards" on page 60.

The system provides space for one optional slimline optical drive. The optical drive tray connects to the controller on the system board through the sideplane board. For more information, see "Installing the Optical Drive Tray" on page 73.

The hard-drive bays provide space for up to two 3.5-inch or four 2.5-inch SAS/SATA hard drives. The hard drives connect to a SAS controller daughter card or a SAS RAID controller daughter card. For more information, see "Installing a Hot-Plug Hard Drive" on page 75.

During an installation or troubleshooting procedure, you may be required to change a jumper setting. For more information, see "Jumpers and Connectors" on page 115.

NOTE: There are no hot-pluggable components inside this system except for externally accessible components, such as the power supplies and the hard drives.

Removing and Replacing the Front Bezel

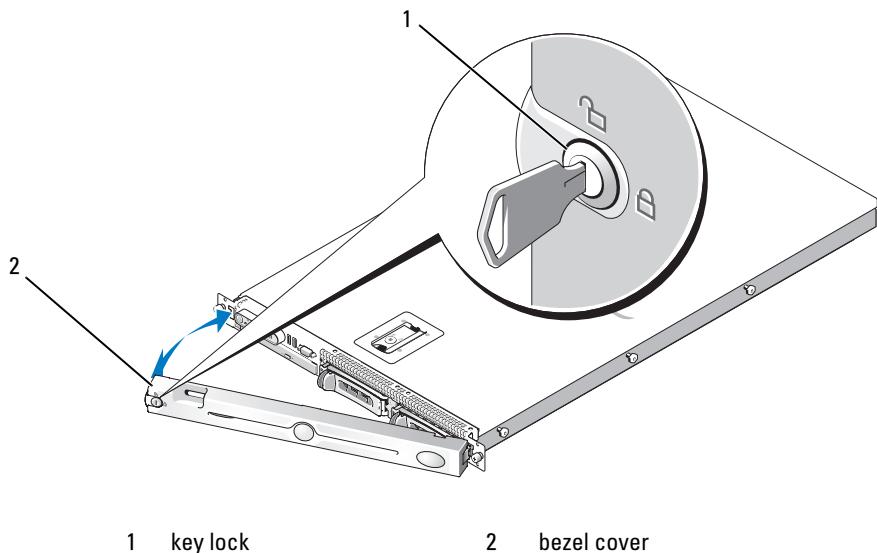

1 The system is enclosed by an optional bezel. To upgrade or troubleshoot the system, remove the bezel and cover to access the internal system components. Unless you are installing a hot-plug hard drive, turn off the system and attached peripherals, and disconnect the system from the electrical outlet and peripherals.

NOTE: You do not need to remove the front bezel to remove the system cover.

- Using the system key, unlock the bezel.
- Press the tab at the left end of the bezel.
- Rotate the left end of the bezel away from the system to release the right end of the bezel.
- Pull the bezel away from the system. See Figure 3-2.

Figure 3-2. Removing the Bezel

To replace the front bezel, perform the preceding steps in reverse.

Opening and Closing the System

- !** **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.
- !** **CAUTION:** Whenever you need to lift the system, get others to assist you. To avoid injury, do not attempt to lift the system by yourself.
- !** **CAUTION:** The memory modules can become extremely hot during normal operation. Allow the modules sufficient time to cool before handling.

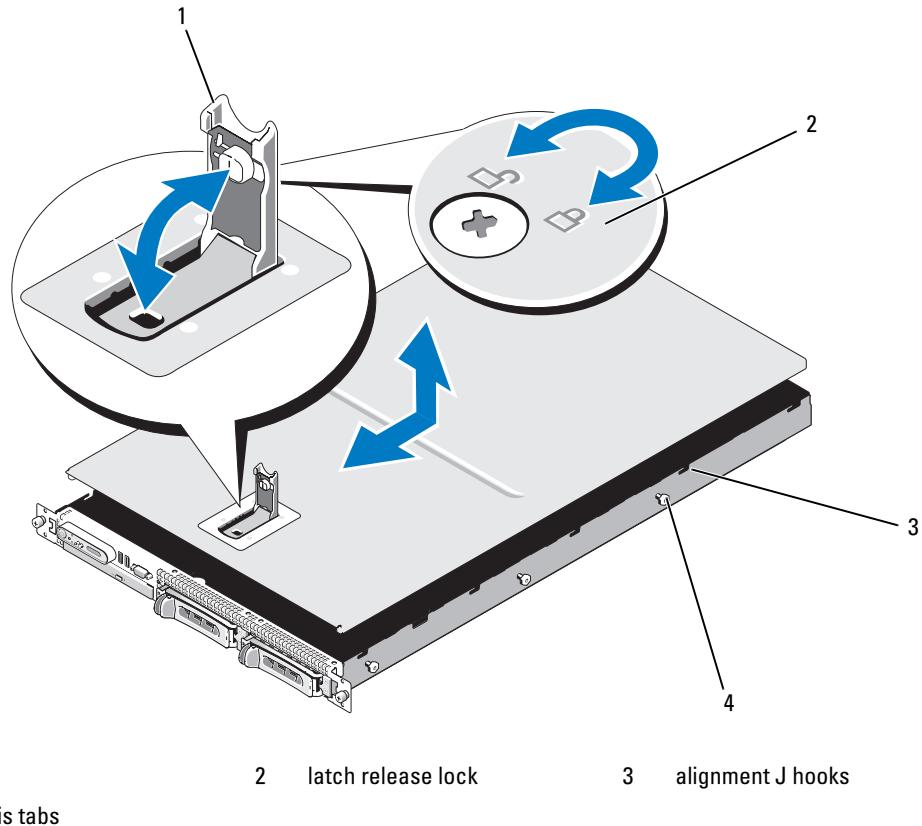

Opening the System

To upgrade or troubleshoot the system, remove the system cover to gain access to internal components.

- 1 Turn off the system and attached peripherals, and disconnect the system from the electrical outlet and peripherals.
- 2 Remove the bezel. See "Removing and Replacing the Front Bezel" on page 47.
- 3 To remove the system cover, rotate the latch release lock on the latch in a counter clockwise direction to the unlocked position. See Figure 3-3.

- 4 Lift up on the latch on top of the system to guide it back and into an offset position. See Figure 3-3.
- 5 Grasp the cover on both sides and carefully lift the cover away from the system.

Figure 3-3. Removing the Cover

Closing the System

- 1 Lift up the latch on the cover.
- 2 Place the cover on top of the system and offset the cover slightly back so that it clears the chassis J hooks and lays flat on the system chassis. See Figure 3-3.
- 3 Lower the cover into the closed position aligning it with the J hooks and push down on the latch to guide the cover into place.
- 4 Rotate the latch release lock in a clockwise direction to secure the cover.

Cooling Fan Modules

This system contains four cooling fan modules, each comprised of two dual-rotor fans, for a total of eight fans that are connected directly to the system board.

Removing a Cooling Fan Module

 **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

 **NOTE:** The procedure for removing each individual fan module is the same.

- 1 Turn off the system and attached peripherals, and disconnect the system from the electrical outlet and peripherals.
- 2 Open the system. See "Opening and Closing the System" on page 48.

 **NOTE:** You can remove the fan modules without removing the memory cooling shroud; however, Dell recommends that you remove this shroud before removing a fan module. Do not remove the system board cooling shroud. See "Removing the Memory Cooling Shroud" on page 53.

- 3 Raise the fan handle, disconnect the module wire harness from the system board, and pull the fan straight up to clear the chassis. See Figure 3-4.
- 4 Unplug the fan module connector.

Figure 3-4. Removing and Installing a Cooling Fan

1	cooling fan modules (4)	2	fan module handles	3	module wire harness
4	cooling fan module connector	5	system board cooling shroud		

Replacing a Cooling Fan Module

NOTE: The procedure for installing each individual fan is the same.

- 1 Ensure that the fan handle is upright and lower the fan into its retention base until the fan is fully seated. Then lower the fan handle until it snaps into place. See Figure 3-4.
- 2 Attach the fan module connectors.
- 3 If you removed the memory cooling shroud to access the fan modules, replace the shroud. See "Replacing the Memory Cooling Shroud" on page 54.
- 4 Close the system. See "Opening and Closing the System" on page 48.

Cooling Shrouds

Your system contains two cooling shrouds.

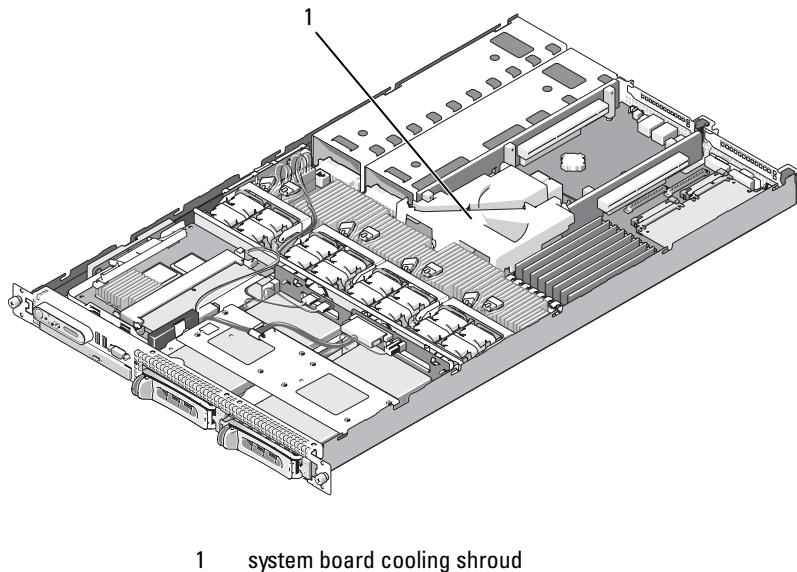

- System board cooling shroud
- Memory cooling shroud

System Board Cooling Shroud

The system board cooling shroud directs airflow over the system memory modules, channeling the air from the four fan modules. Your system comes with the system board cooling shroud pre installed on the system board. See Figure 3-6 and "System Board Removal" on page 90.

 **NOTE:** Because the system board shroud comes pre-installed on your system and does not cover any components, do not attempt to remove this shroud from the system board.

Figure 3-5. System Board Cooling Shroud

1 system board cooling shroud

Memory Cooling Shroud

The memory cooling shroud covers both the memory modules (DIMMs) and the processors. This shroud can be removed and installed. See Figure 3-6 and "System Board Removal" on page 90.

Removing the Memory Cooling Shroud

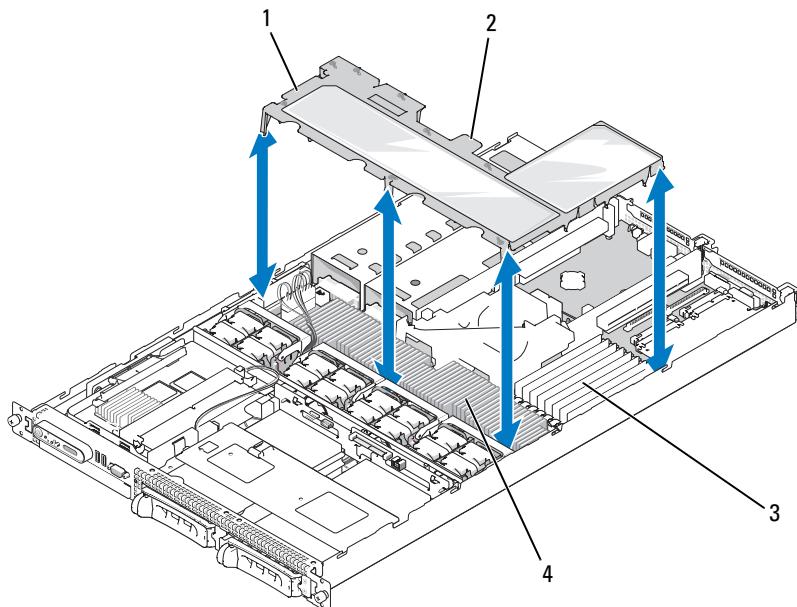

! **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

! **CAUTION:** The memory modules are hot to the touch for some time after the system has been powered down. Allow time for the memory modules to cool before handling them. Handle the memory modules by the card edges and avoid touching the components on the memory module.

→ **NOTICE:** Never operate your system with the memory cooling shroud removed. Overheating of the system can develop quickly resulting in a shutdown of the system and the loss of data.

- 1 To remove the cooling shroud, locate the release tab on the shroud edge that is nearest to the adjacent system board shroud. See Figure 3-6.
- 2 Pull up on the release tab to release the memory cooling shroud.
- 3 Unseat the shroud from the securing tabs located on the periphery of the shroud.
- 4 Carefully lift the shroud straight up to disengage it from the system board, and then lift the shroud away from the system.

Figure 3-6. Memory Cooling Shroud

1	memory cooling shroud	2	memory shroud release tab	3	memory modules (8)
4	system processors (2)				

Replacing the Memory Cooling Shroud

- 1 To install the memory cooling shroud, align the shroud directly over the memory modules and the processors.
- 2 Using the interior system board cooling shroud as a guide, slowly lower the shroud straight down onto the system, directly over the processors and memory modules.
- 3 Gently press around the periphery of the shroud until it engages with the external tabs and snaps into place.

Power Supplies

Your system supports one or two power supplies rated at an output of 670 W. If only one power supply is installed, it must be installed in the left power supply bay (bay 1). If two power supplies are installed, the second power supply serves as a redundant, hot-plug power source.

 **NOTICE:** In a non-redundant configuration, the power supply blank must be installed in the unoccupied power supply bay to ensure proper system cooling. See "Installing the Power Supply Blank" on page 56.

Removing a Power Supply

 **NOTICE:** The system requires one power supply for the system to operate normally. The system is in the redundant mode when two power supplies are installed and both power supplies are connected to an AC power source. Remove and replace only one power supply at a time in a system that is powered on. Operating the system with only one power supply installed and without a power supply blank installed for extended periods of time can cause the system to overheat.

 **NOTICE:** If only one power supply is installed, it must be installed in the left power supply bay (1).

 **NOTICE:** If you connect the system to a power source in the range of 120 to 220 VAC, and if two power supplies are installed, the second power supply serves as a redundant, hot-plug power source.

 **NOTE:** On your rack system, you may have to unlatch and lift the cable management arm if it interferes with power supply removal. For information about the cable management arm, see the system's *Rack Installation Guide*.

- 1 If your system has a single power supply, turn off the system and all attached peripherals. For a redundant system, you can leave the system running and proceed to the next step.
- 2 Disconnect the power cable from the power source.
- 3 Disconnect the power cable from the power supply and remove the cable from the cable retention bracket.

 **NOTICE:** On a rack system, you may need to temporarily unlatch and lift the cable management arm. For information about the cable management arm, see the system's *Rack Installation Guide*.

- 4 Release the locking tab on the left side of the power supply by pressing in toward the right until the power supply is released from the chassis. See Figure 3-7.
- 5 Holding the power-supply handle, pull the power supply straight out to clear the chassis.

Figure 3-7. Removing and Installing a Power Supply

1 power-supply	2 power-supply handle	3 cable retention bracket
4 power supply blank	5 power-supply bay 2 (optional)	6 redundant power supply bay 1
7 locking tab		

Replacing a Power Supply

- 1 If you are adding a second power supply, remove the power supply blank. See "Removing a Power Supply" on page 54.
- 2 Holding the power-supply handle, slide the new power supply into the chassis until it is fully seated and contacts the system chassis. See Figure 3-7.

➡ **NOTICE:** On a rack system, you may need to temporarily unlatch and lift the cable management arm. For information about the cable management arm, see the system's *Rack Installation Guide*.

- 3 Insert the power cable through the cable retention bracket, connect the power cable to the power supply, and plug the cable into a power outlet.

➡ **NOTICE:** For more information about the power cable retention bracket, see the *Getting Started With Your System* guide.

💡 **NOTE:** After installing a new power supply in a system with two power supplies, allow several seconds for the system to recognize the power supply and determine its status. The power-supply status indicator turns green to signify that the power supply is functioning properly (see Figure 1-4).

Removing the Power Supply Blank

Press the latch on the left side to release and remove the blank, rotating the blank slightly to clear the bay, and remove from the chassis.

 **NOTICE:** To ensure proper system cooling, the power supply blank must be installed on the unoccupied power supply bay in a non-redundant configuration. Remove the power supply blank only if you are installing a second power supply.

Installing the Power Supply Blank

To install the power supply blank, insert the tab on the right edge of the blank into the slot in the power supply bay wall. Rotate the blank into the power supply bay until it is fully seated.

SAS Controller Daughter Card

Your system includes a dedicated slot on the sideplane for an optional SAS controller daughter card. The SAS controller daughter card provides the SAS storage subsystem for your system's two optional internal hard drives. The optional SAS RAID controller daughter card allows you to set up any internal hard drives in a RAID configuration.

Removing a SAS Controller Daughter Card

- 1 If you are removing a SAS RAID controller daughter card, disconnect the battery cable from the card by releasing the tab on the cable connector on the daughter card. See Figure 3-26.
- 2 Pull on the release latch on the daughter card (see Figure 3-8) and slide the daughter card tray towards the hard drives.
- 3 Continue to hold the guide rails outward as you pull the SAS controller daughter card upward from the rails.

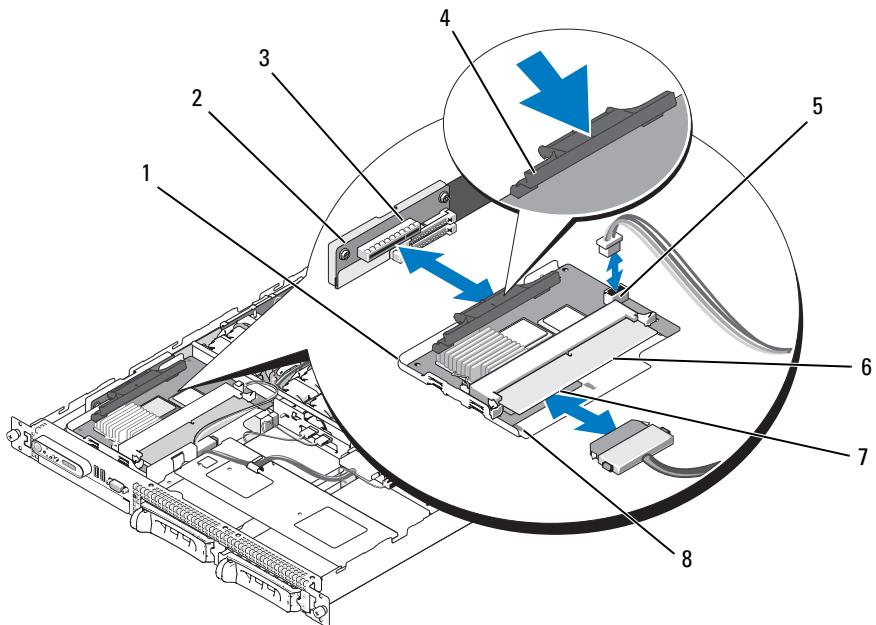

Installing a SAS Controller Daughter Card or SAS RAID Controller Daughter Card

 **NOTICE:** If you are installing a SAS RAID daughter card, be careful not to press on the memory module on the card (see Figure). to avoid damaging the memory module or its socket.

 **NOTICE:** If you are installing a new or replacement SAS RAID daughter card, do not remove the card's plastic cover until you have completed installing the card.

- 1 Hold the metal daughter card tray by its edges with the release latch and edge connector facing the sideplane board. See Figure 3-8.
- 2 Align the two slots in the daughter card tray and the corresponding tabs on the chassis, then lower the card tray onto the chassis.
- 3 Slide the daughter card tray towards the sideplane until the edge connector on the daughter card fits into the socket on the sideplane board and the release latch engages. See Figure 3-8.

4 Attach any cables from the internal storage daughter card to the backplane, referring to Figure 3-9 and Figure 3-10 for the cabling guidelines for your system's card and backplane configuration.

► **NOTICE:** You must follow the cabling diagrams for connecting the hard drives to either of the internal storage daughter cards that are illustrated in the following figures to ensure proper connection. Figure 3-9 illustrates the cable routing for the SAS controller daughter card and Figure 3-10 illustrates the cable routing for the SAS RAID controller daughter card.

RAID Battery

Installing a RAID Battery

- 1 Locate the RAID battery pocket on the chassis that is adjacent to hard drive bay 0. See Figure 3-11.
- 2 Insert the battery in the battery pocket.
- 3 Connect the battery cable to the RAID controller daughter card. See Figure 3-11.

Figure 3-11. Installing a SAS RAID Battery

Removing a RAID Battery

- 1 Disconnect the RAID battery cable from the SAS RAID daughter card. See Figure 3-11.
- 2 Press the release latch toward the hard-drive bays and remove the battery from the battery socket.

Expansion Cards

The system is available with one of two optional PCI riser configurations.

PCIe Riser Board Expansion Slots

The PCIe riser configuration provides two PCI Express expansion slots with the following features:

- Two PCIe risers, installed in the left and center riser connectors.
- Two x8-lane PCIe expansion slots.
- Support for full height/half-length PCI cards in both slots.

PCI-X Riser Board Expansion Slots

The PCI-X riser configuration provides two PCI-X slots with the following features:

- Two PCI-X risers, installed in the left and center riser connectors.
- Two PCI-X 64-bit/133-MHz expansion slots (on separate buses).
- Support for full height/half-length PCI cards in both slots.

Expansion Card Installation Guidelines

 **NOTE:** You cannot combine PCIe and PCI-X risers. Two risers must be installed or the system will not power up.

 **NOTE:** The expansion-card slots are not hot-pluggable.

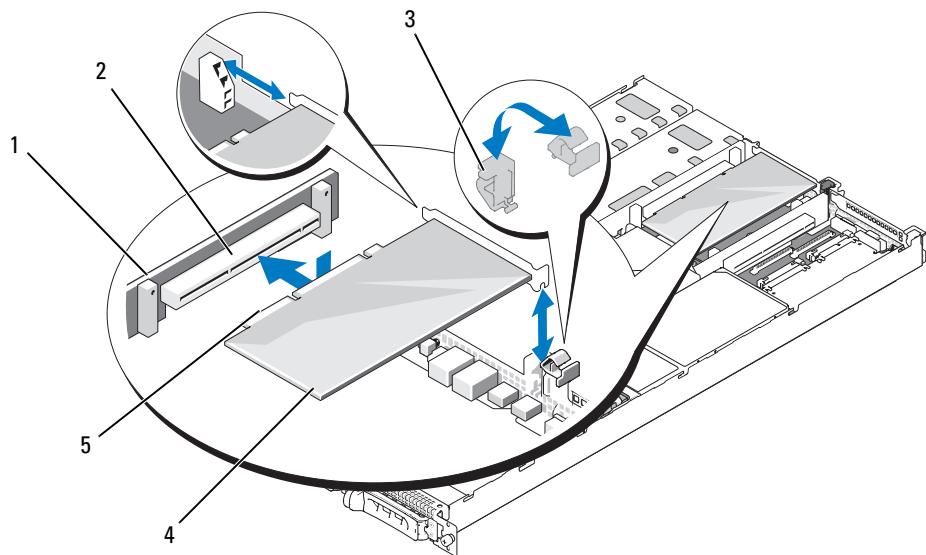

To identify expansion slots, see Figure 3-12. The two expansion card slots are on separate buses.

Installing an Expansion Card

 **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

- 1 Unpack the expansion card and prepare it for installation.
For instructions, see the documentation accompanying the card.
- 2 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet.
- 3 Open the system. See "Opening and Closing the System" on page 48.
- 4 If you are adding a new card, open the expansion-card latch and remove the filler bracket. See Figure 3-12.
- 5 Install the expansion card:
 - a Position the expansion card so that the card-edge connector aligns with the expansion-card connector on the PCI riser board.
 - b Insert the card-edge connector firmly into the expansion-card connector until the card is fully seated.
 - c When the card is seated in the connector, close the expansion-card latch. See Figure 3-12.

6 Connect any cables to the expansion card.

See the documentation that came with the card for information about its cable connections.

7 Close the system. See "Opening and Closing the System" on page 48.

Removing an Expansion Card

! **CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.**

- 1 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet.
- 2 Open the system. See "Opening and Closing the System" on page 48.
- 3 Disconnect all cables from the card.
- 4 Remove the expansion card:
 - a Open the expansion-card latch. See Figure 3-12.
 - b Grasp the expansion card by its edges, and carefully remove it from the expansion-card connector.

- 5 If you are removing the card permanently, install a metal filler bracket over the empty expansion slot opening and close the expansion-card latch.

NOTE: You must install a filler bracket over an empty expansion slot to maintain Federal Communications Commission (FCC) certification of the system. The brackets also keep dust and dirt out of the system and aid in proper cooling and airflow inside the system.

- 6 Close the system. See "Opening and Closing the System" on page 48.

Configuring the Boot Device

If you plan to boot the system from a hard drive, the drive must be attached to the primary (or boot) controller. The device that the system boots from is determined by the boot order specified in the System Setup program.

The System Setup program provides options that the system uses to scan for installed boot devices. See "Using the System Setup Program" on page 33 for information about the System Setup program.

Configuring the Boot Drive

The drive or device from which the system boots is determined by the boot order specified in the System Setup program. See "Using the System Setup Program" on page 33 for information about the System Setup program.

System Memory

You can upgrade your system memory to a maximum of 32 GB by installing 533-MHz or 667-MHz fully buffered (FB) DDR II memory modules (DIMMs) in sets of 256-MB, 512-MB, 1-GB, 2-GB, or 4-GB modules. The eight memory sockets are located on the system board under the memory cooling shroud. You can purchase memory upgrade kits from Dell.

NOTICE: If you remove your original memory modules from the system during a memory upgrade, keep them separate from any new memory modules that you may have, even if you purchased the new memory modules from Dell. Use only 533-MHz or 667-MHz DDR II fully buffered DIMMs (FBDs).

The memory module sockets are divided into two equal branches (0 and 1). Each branch consists of two channels:

- Channel 0 and channel 1 are in branch 0.
- Channel 2 and channel 3 are in branch 1.

Each channel consists of two memory module sockets:

- Channel 0 contains DIMM_1, DIMM_5.
- Channel 1 contains DIMM_2, DIMM_6.

- Channel 2 contains DIMM_3, DIMM_7.
- Channel 3 contains DIMM_4, DIMM_8.

The first DIMM socket of each channel has white release tabs.

General Memory Module Installation Guidelines

To ensure optimal performance of your system, observe the following guidelines when configuring your system memory.

- Use only qualified FBDs. FBDs can be either single-ranked or dual-ranked. FBDs marked with a 1R are single-ranked and modules marked with a 2R are dual-ranked.
- A minimum of two identical FBDs must be installed.
- DIMM sockets must be populated by lowest number first.
- Memory modules must be installed in pairs of matched memory size, speed, and technology, and the total number of memory modules in the configuration must total two, four, or eight. For best system performance, all four, or eight memory modules should be identical in size, speed, and technology.
- Memory sparing and memory mirroring require eight memory, and all memory modules must be of identical memory size, speed, and technology.
- Memory sparing and memory mirroring cannot be implemented at the same time.

Non-Optimal Memory Configurations

System performance can be affected if your memory configuration does not conform to the preceding installation guidelines. Your system may issue an error message during startup stating that your memory configuration is non-optimal.

Memory Sparing Support

The system supports memory sparing if eight identical memory modules are installed in the system. The memory sparing feature must be enabled in the System Setup program and can be used only if memory mirroring is not enabled.(See "Using the System Setup Program" on page 33.)

Memory sparing allocates four ranks of DIMM memory to the spare bank. These four ranks consist of the first rank of memory in DIMM sockets 1 through 4. For single-rank DIMMs, the entire capacity of the four DIMMs is allocated to sparing whereas for dual-rank DIMMs, only half of the four-DIMM capacity is allocated to sparing. Table 3-1 shows how memory sparing splits the available and spared memory in each of the single- and dual-ranked memory module combinations.

Table 3-1. Memory Sparing Configurations

DIMMs	Size/Type	Total Memory	Available	Spare
8	256-MB single-rank	2 GB	1 GB	1 GB
	512-MB single-rank	4 GB	2 GB	2 GB
	1-GB single-rank	8 GB	4 GB	4 GB
	2-GB single-rank	16 GB	8 GB	8 GB
	2-GB dual-rank	16 GB	12 GB	4 GB
	4-GB dual-rank	32 GB	24 GB	8 GB

Memory Mirroring Support

The system supports memory mirroring if eight identical memory modules are installed in the system. Mirroring must be enabled in the System Setup program and can be used only if memory sparing is not enabled. (See "Using the System Setup Program" on page 33.) In a mirrored configuration, the total available system memory is one-half of the total installed memory.

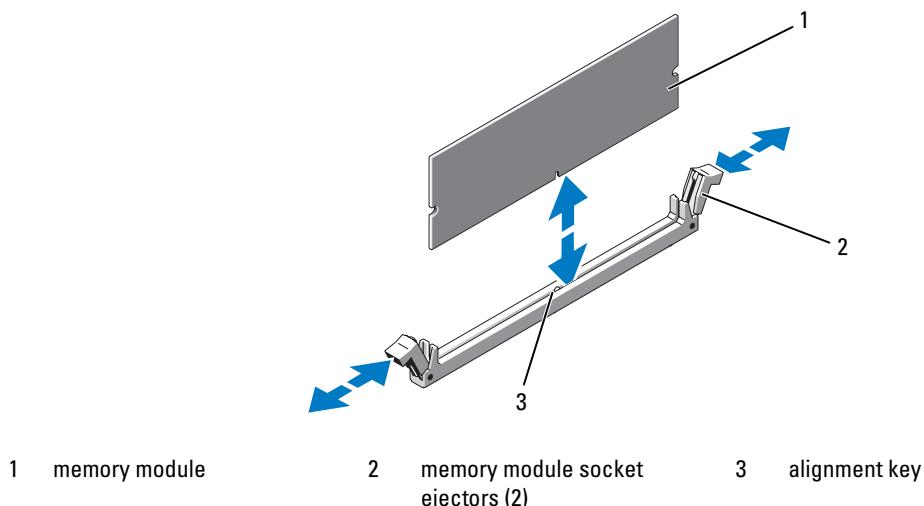

Installing Memory Modules

! **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

! **CAUTION:** The memory modules are hot to the touch for some time after the system has been powered down. Allow time for the memory modules to cool before handling them. Handle the memory modules by the card edges and avoid touching the components on the memory module.

- 1 Open the system. See "Opening and Closing the System" on page 48.
- 2 Remove the memory cooling shroud. See "Removing the Memory Cooling Shroud" on page 53.
- 3 Locate the memory module sockets. See Figure 6-2.
- 4 Press the ejectors on the memory module socket down and out, as shown in Figure 3-13, to allow the memory module to be inserted into the socket.
- 5 Handle each memory module only on either card edge, ensuring not to touch the middle of the memory module.

Figure 3-13. Installing and Removing a Memory Module

- 6 Align the memory module's edge connector with the alignment key of the memory module socket, and insert the memory module in the socket.

NOTE: The memory module socket has an alignment key that allows you to install the memory module in the socket in only one way.

- 7 Press down on the memory module with your thumbs while pulling up on the ejectors with your index fingers to lock the memory module into the socket.

When the memory module is properly seated in the socket, the ejectors on the memory module socket align with the ejectors on the other sockets that have memory modules installed.

- 8 Repeat step 3 through step 7 of this procedure to install the remaining memory modules. See Table 3-1.

- 9 Replace the memory cooling shroud. See "Replacing the Memory Cooling Shroud" on page 54.

- 10 Close the system. See "Opening and Closing the System" on page 48.

- 11 Press **<F2>** to enter the System Setup program, and check the **System Memory** setting on the main **System Setup** screen.

The system should have already changed the value to reflect the newly installed memory.

- 12 If the value is incorrect, one or more of the memory modules may not be installed properly. Repeat step 1 through step 11 of this procedure, checking to ensure that the memory modules are firmly seated in their sockets.

- 13 Run the system memory test in the system diagnostics. See "Running the System Diagnostics" on page 111.

Activating the Integrated NIC TOE

To add TCP/IP Offload Engine (TOE) functionality to the system's integrated NIC, install the TOE NIC hardware key in the TOE_KEY socket on the system board (see Figure 6-2.)

Processors

You can upgrade your processor(s) to take advantage of future options in speed and functionality. Each processor and its associated internal cache memory are contained in a land grid array (LGA) package that is installed in a ZIF socket on the system board.

The following items are included in the processor upgrade kit:

- Processor
- Heat sink

Removing the Processor

! **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

- 1 Prior to upgrading your system, download the latest system BIOS version on support.dell.com.

- 2 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet.
- 3 Open the system. See "Opening and Closing the System" on page 48.
- 4 Remove the memory cooling shroud. See "Removing the Memory Cooling Shroud" on page 53.

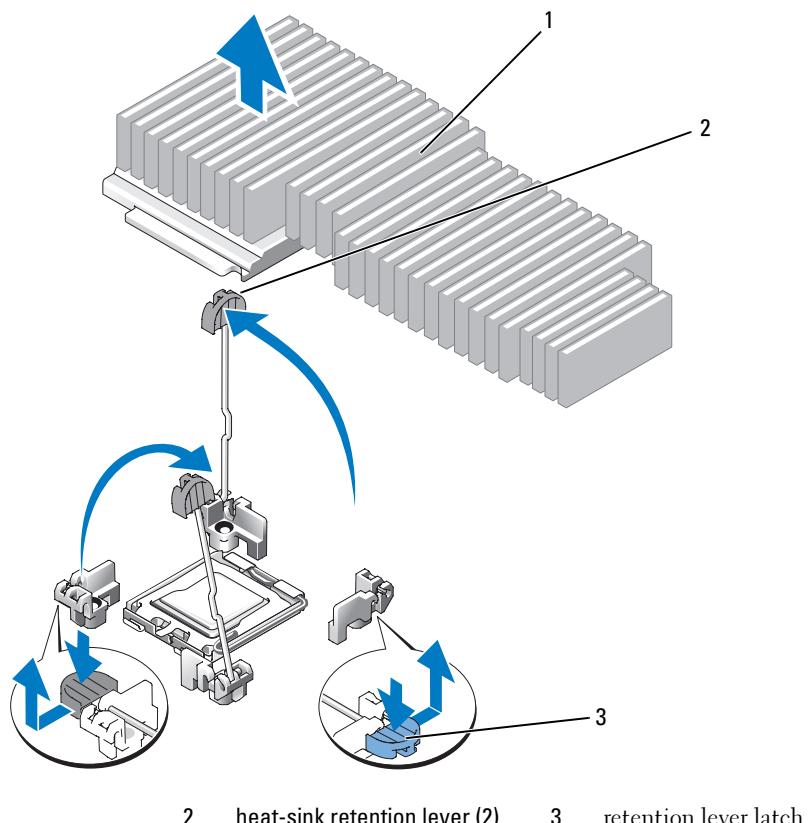

► **NOTICE:** When you remove the heat sink, the possibility exists that the processor might adhere to the heat sink and be removed from the socket. It is recommended that you remove the heat sink while the processor is warm.

► **NOTICE:** Never remove the heat sink from a processor unless you intend to remove the processor. The heat sink is necessary to maintain proper thermal conditions.

► **NOTICE:** The processor and heat sink can become extremely hot. Be sure the processor has had sufficient time to cool before handling.

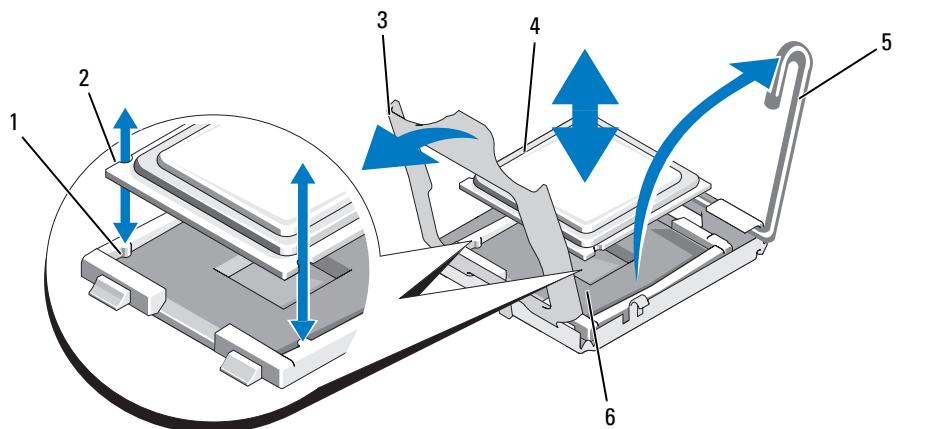

- 5 Press the blue tab on the end of one of the heat-sink retention levers to disengage the lever, then lift the lever 90 degrees. See Figure 3-14.

Figure 3-14. Installing and Removing the Heat Sink

- 6 Wait 30 seconds for the heat sink to loosen from the processor.
- 7 Open the other heat sink retention lever.
- 8 If the heat sink has not separated from the processor, carefully rotate the heat sink in a clockwise, then counterclockwise, direction until it releases from the processor. Do not pry the heat sink from the processor.
- 9 Lift the heat sink off of the processor and set the heat sink upside down so as not to contaminate the thermal grease.
- 10 Pull the socket-release lever 90 degrees upward until the processor is released from the socket. See Figure 3-15.
- 11 Rotate the processor shield upward and out of the way.

Figure 3-15. Installing and Removing the Processor

1	socket key (2)	2	notch in processor	3	processor shield
4	processor	5	socket-release lever	6	ZIF socket

- 12 Lift the processor shield to release the processor, and then lift the processor out of the socket. Leave the release lever up so that the socket is ready for the new processor.

NOTICE: Be careful not to bend any of the pins on the LGA socket when removing the processor. Bending the pins can permanently damage the socket and system board.

Installing a Processor

- 1 Unpack the new processor.
- 2 Align the processor with the socket keys on the ZIF socket. See Figure 3-15.
- 3 Install the processor in the socket.

 **NOTICE:** Positioning the processor incorrectly can permanently damage the system board or the processor when you turn the system on.

- a If the release lever on the processor socket is not positioned all the way up, move it to that position.
- b With the processor and the socket keys aligned, set the processor lightly in the socket.

 **NOTICE:** Do not use force to seat the processor. When the processor is positioned correctly, it engages easily into the socket.

- c When the processor is fully seated in the socket, rotate the socket release lever back down until it snaps into place, securing the processor. See Figure 3-15.
- d Close the processor shield. See Figure 3-15.

- 4 Install the heat sink.

 **NOTE:** If you did not receive a replacement heat sink, use the heat sink that you removed in step 9.

- a If you receive a heat sink and pre-applied thermal grease with your processor kit, remove the protective sheet from the thermal grease layer on top of the heat sink.

If you did not receive a replacement heat sink with your processor kit, do the following:

- Using a clean lint-free cloth, remove the existing thermal grease from the heat sink you removed in step 9.
- Open the grease packet included with your processor kit and apply thermal grease evenly to the top of the processor.

- b Place the heat sink onto the processor. See Figure 3-14.
- c Close one of the two heat sink retention levers until it locks. See Figure 3-14.
- d Repeat for the other heat sink retention lever.

- 5 Close the system. See "Closing the System" on page 49.

As the system boots, it detects the presence of the new processor and automatically changes the system configuration information in the System Setup program.

- 6 Press **<F2>** to enter the System Setup program, and check that the processor information matches the new system configuration.

See "Using the System Setup Program" on page 33 for instructions about using the System Setup program.

- 7 Run the system diagnostics to verify that the new processor operates correctly.

See "Running the System Diagnostics" on page 111 for information about running the diagnostics.

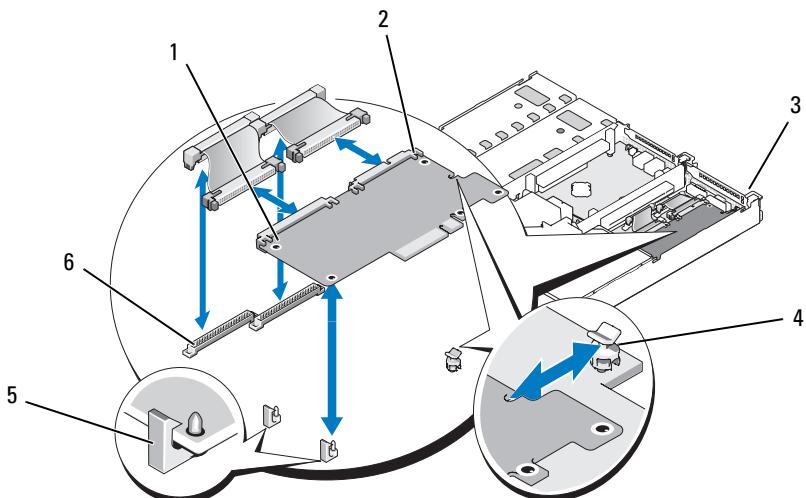

RAC Card

! **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

The optional Remote Access Controller (RAC) provides a set of advanced features for managing the server remotely. The following procedure describes the steps for installing the optional RAC card.

- 1 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet.

Hard Drives

This subsection describes how to install and configure SAS or SATA hard drives in the system's internal hard-drive bays. Your system features the option of two 3.5-inch (SAS/SATA) internal hard-drive bays or four 2.5-inch (SAS only) internal hard-drive bays that accommodate up to either two or four hard drives. All drives connect to the system board through one of two optional backplane boards.

 **NOTE:** Depending on the hard drive configuration you ordered, your hard drive(s) may come with a drive interposer that allows your SATA drive to attach to the SAS connector on the backplane.

Before You Begin

Hard drives are supplied in special hot-pluggable drive carriers that fit in the hard-drive bays. Depending on your configuration, you received one of the following two drive carrier types:

- SATA drive carrier — Usable only with a SATA hard drive.
- SATAU drive carrier — Usable with either a SAS hard drive or a SATA hard drive with a universal interposer card. The interposer card provides enhanced functionality that makes the SATA hard drive usable in some storage systems.

 **NOTICE:** Before you attempt to remove or install a drive while the system is running, see the documentation for the optional SAS RAID daughter card to ensure that the host adapter is configured correctly to support hot-pluggable drive removal and insertion.

 **NOTE:** It is recommended that you use only drives that have been tested and approved for use with the SAS backplane board.

You may need to use different programs than those provided with the operating system to partition and format SAS or SATA hard drives.

 **NOTICE:** Do not turn off or reboot your system while the drive is being formatted. Doing so can cause a drive failure.

When you format a high-capacity hard drive, allow enough time for the formatting to be completed. Long format times for these drives are normal. A 9-GB hard drive, for example, can take up to 2.5 hours to format.

Removing a Drive Blank

 **NOTICE:** To maintain proper system cooling, all empty hard-drive bays must have drive blanks installed. If you remove a hard-drive carrier from the system and do not reinstall it, you must replace the carrier with a drive blank.

The process for removing a drive blank depends on whether your system is configured with 3.5-inch or 2.5-inch hard drives.

For 3.5-inch hard drive configurations:

- 1 Remove the front bezel, if attached. See "Removing and Replacing the Front Bezel" on page 47.
- 2 Insert your finger under the shrouded end of the blank and press in on the latch to eject the blank outward from the bay.
- 3 Pry the ends of the blank outward until the blank is free.

For 2.5-inch hard drive configurations, remove the blank as you would the 2.5-inch hard drive carrier:

- 1 Remove the front bezel, if attached. See "Replacing the System Battery" on page 85.
- 2 Open the drive blank release handle to release the blank. See Figure 3-18.
- 3 Slide the drive blank out until it is free of the drive bay.

Installing a Drive Blank

The process for installing a drive blank depends on whether your system is configured with 3.5-inch or 2.5-inch hard drives.

For 3.5-inch hard drive configurations, the drive blank is keyed to ensure correct insertion into the drive bay. To install a 3.5-inch drive blank, insert the blank into the drive bay rotating in with the key side first, and press evenly on the ends of the blank until it is fully inserted and latched.

For 2.5-inch hard drive configurations, install the hard drive blank as a 2.5-inch hard drive carrier:

- 1 Remove the front bezel, if attached. See "Removing and Replacing the Front Bezel" on page 47.
- 2 Open the handle on the hard-drive blank.
- 3 Insert the hard-drive blank into the drive bay until it is fully seated.
- 4 Close the handle to lock the blank in place.
- 5 Replace the front bezel, if it was removed in step 1.

Installing a Hot-Plug Hard Drive

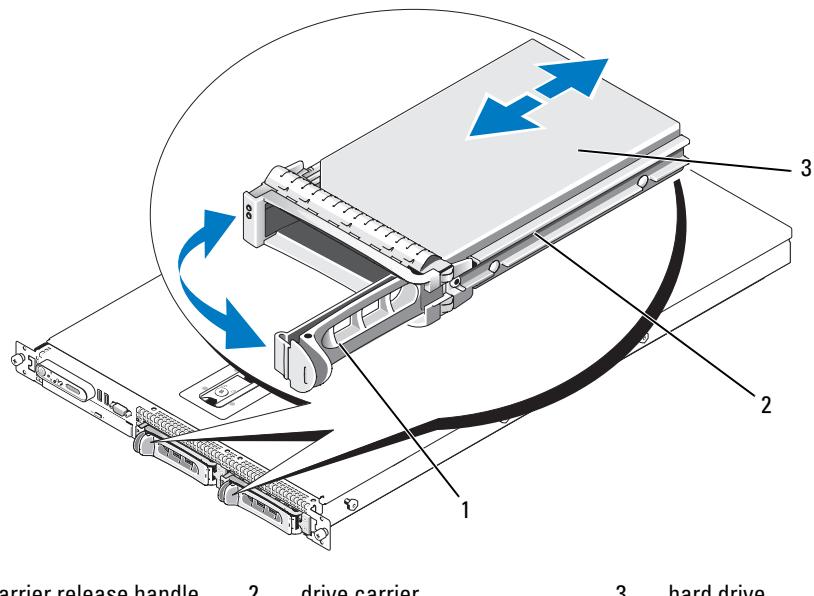

► **NOTICE:** When installing a hard drive, ensure that the adjacent drives are fully installed. Inserting a hard-drive carrier and attempting to lock its handle next to a partially installed carrier can damage the partially installed carrier's shield spring and make it unusable.

► **NOTICE:** Not all operating systems support hot-plug drive installation. See the documentation supplied with your operating system.

- 1 Remove the front bezel if attached. See "Removing and Replacing the Front Bezel" on page 47.
- 2 If a drive blank is present in the bay, remove it. See "Removing a Drive Blank" on page 74.

- 3 Install the hot-plug hard drive.
 - a Open the hard-drive carrier handle. See Figure 3-18.

Figure 3-18. Installing a Hot-Plug Hard-Drive

NOTICE: Do not insert a hard-drive carrier and attempt to lock its handle next to a partially installed carrier. Doing so can damage the partially installed carrier's shield spring and make it unusable. Ensure that the adjacent drive carrier is fully installed.

- b Insert the hard-drive carrier into the drive bay until the carrier contacts the backplane. See Figure 3-18.
 - c Close the hard-drive carrier handle to lock it in place.
- 4 Replace the front bezel if it was removed in step 1. See "Removing and Replacing the Front Bezel" on page 47.

Replacing a Hard-Drive Carrier

Removing a Hard Drive From a Hard-Drive Carrier

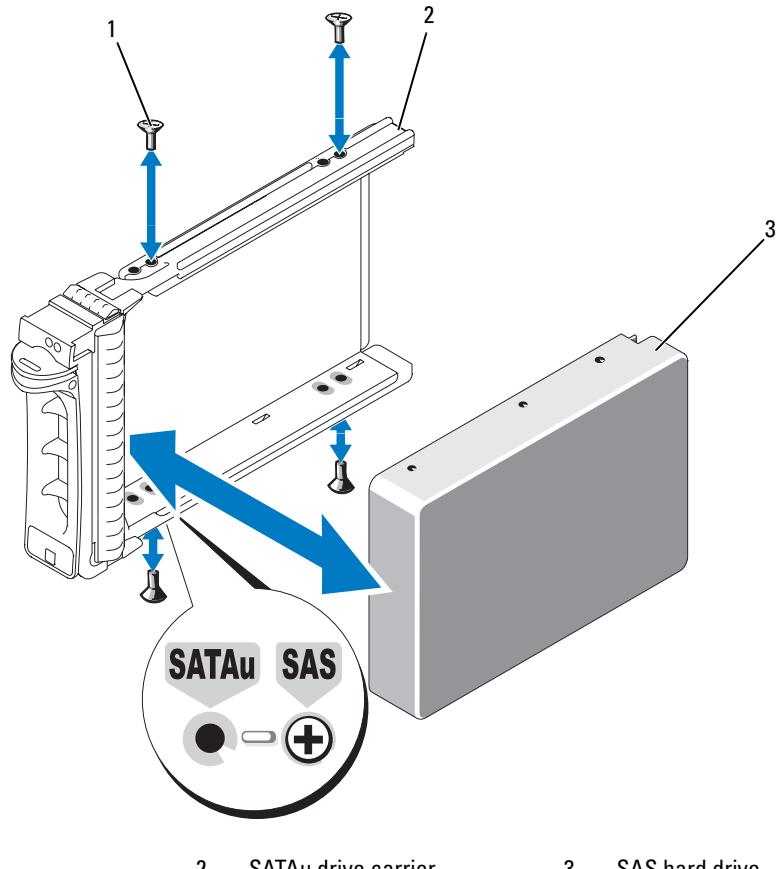

- 1 If you are removing a SATA hard drive from a SATAu drive carrier, remove the interposer card:
 - a Viewing the hard drive carrier from the rear, locate the release lever on the left end of the interposer card.
 - b Push the lever away from the carrier rail to release the left end of the card.
 - c Rotate the left end away from the hard drive to release the connector.
 - d Pull the right end of the interposer card clear of the slots in the carrier rail.
- 2 Remove the four screws from the slide rails on the hard-drive carrier and separate the hard drive from the carrier.

Installing a SAS Hard Drive Into a SATAu Drive Carrier

 **NOTE:** SAS hard drives must be installed only in SATAu drive carriers. The SATAu drive carrier is labeled "SATAu" and also has marks indicating the SAS and SATA mounting screws.

- 1 Insert the SAS hard drive into the hard-drive carrier with the connector end of the drive at the rear. See Figure 3-19.
- 2 Viewing the assembly as shown in Figure 3-19, align the bottom rear screw hole on the hard drive with the hole labeled "SAS" on the hard drive carrier.
When aligned correctly, the rear of the hard drive will be flush with the rear of the hard-drive carrier.
- 3 Attach the four screws to secure the hard drive to the hard-drive carrier. See Figure 3-19.

Troubleshooting Your System

Safety First—For You and Your System

To perform certain procedures in this document, you must remove the system cover and work inside the system. While working inside the system, do not attempt to service the system except as explained in this guide and elsewhere in your system documentation.

 **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

Start-Up Routine

Look and listen during the system's start-up routine for the indications described in Table 1-1.

Table 4-1. Start-Up Routine Indications

Look/listen for:	Action
A status or error message displayed on the front-panel LCD.	See "LCD Status Messages" on page 17.
An error message displayed on the monitor.	See "System Messages" on page 25.
Alert messages from the systems management software.	See the systems management software documentation.

The hard-drive activity indicator.	See "Troubleshooting a Hard Drive" on page 104.
An unfamiliar constant scraping or grinding sound when you access a drive.	See "Getting Help" on page 125.

Checking the Equipment

This section provides troubleshooting procedures for external devices attached to the system, such as the monitor, keyboard, or mouse. Before you perform any of the procedures, see "Troubleshooting External Connections" on page 94.

Troubleshooting IRQ Assignment Conflicts

Most PCI devices can share an IRQ with another device, but they cannot use an IRQ simultaneously. To avoid this type of conflict, see the documentation for each PCI device for specific IRQ requirements. Table 4-2 lists the IRQ assignments.

Table 4-2. IRQ Assignment Defaults

IRQ Line	Assignment
IRQ0	System timer
IRQ1	Keyboard controller
IRQ2	Interrupt controller 1 to enable IRQ8 through IRQ15
IRQ3	<i>Available</i>
IRQ4	Serial port 1 (COM1 and COM3)
IRQ5	Remote access controller
IRQ6	Reserved
IRQ7	Reserved
IRQ8	Real-time clock
IRQ9	ACPI functions (used for power management)
IRQ10	<i>Available</i>
IRQ11	<i>Available</i>
IRQ12	<i>Available</i>
IRQ13	Math coprocessor
IRQ14	IDE CD drive controller
IRQ15	<i>Available</i>

Troubleshooting External Connections

Loose or improperly connected cables are the most likely source of problems for the system, monitor, and other peripherals (such as a printer, keyboard, mouse, or other external device). Ensure that all external cables are securely attached to the external connectors on your system. See "Front-Panel Features and Indicators" on page 11 and "Back-Panel Features and Indicators" on page 14 for the front- and back-panel connectors on your system.

Troubleshooting the Video Subsystem

Problem

- Monitor is not working properly.
- Video memory is faulty.

Action

- 1 Check the system and power connections to the monitor.
- 2 Determine whether the system has an expansion card with a video output connector.

In this system configuration, the monitor cable should normally be connected to the connector on the expansion card, *not* to the system's integrated video connector.

To verify that the monitor is connected to the correct video connector, turn off the system and wait for 1 minute, then connect the monitor to the other video connector and turn the system on again.
- 3 Determine whether the system has monitors attached to both the front and rear video connectors.

The system supports only one monitor attached to either the front or rear video connector. When a monitor is connected to the front panel, the back-panel video connector is disabled.

If two monitors are attached to the system, disconnect one monitor. If the problem is not resolved, continue to the next step.
- 4 Run the appropriate online diagnostic test. See "Using Server Administrator Diagnostics" on page 111.

If the tests run successfully, the problem is not related to video hardware.

If the tests fail, see "Getting Help" on page 125.

Troubleshooting the Keyboard

Problem

- System message indicates a problem with the keyboard
- Keyboard is not functioning properly

Action

- 1 Examine the keyboard and its cable for signs of damage.
- 2 Swap the faulty keyboard with a working keyboard.

If the problem is resolved, replace the faulty keyboard. See "Getting Help" on page 125.
- 3 Enter the System Setup program and ensure that the USB ports are enabled. See "Using the System Setup Program" on page 33.

If the problem is not resolved, see "Getting Help" on page 125.
- 4 Run the appropriate online diagnostic test. See "Using Server Administrator Diagnostics" on page 111.

Troubleshooting the Mouse

Problem

- System message indicates a problem with the mouse.
- Mouse is not functioning properly.

Action

- 1 Examine the mouse and its cable for signs of damage.
If the mouse is not damaged, go to step 4.
- 2 Enter the System Setup program and ensure that the USB ports are enabled. See "Using the System Setup Program" on page 33.
If the mouse is damaged, continue to the next step.
- 3 Swap the faulty mouse with a working mouse.
If the problem is resolved, replace the faulty mouse. See "Getting Help" on page 125.
- 4 If the problem is not resolved, see "Getting Help" on page 125.
- 5 Run the appropriate online diagnostic test. See "Using Server Administrator Diagnostics" on page 111.
If the test fails, continue to the next step.

Troubleshooting Basic I/O Functions

Problem

- Error message indicates a problem with a serial port.
- Device connected to a serial port is not operating properly.

Action

- 1 Enter the System Setup program and ensure that the serial port is enabled, and the serial port/COM ports are configured appropriately for any applications you are using. See "Using the System Setup Program" on page 33.
- 2 If the problem is confined to a particular application, see the application documentation for specific port configuration requirements that the program may require.
- 3 Run the appropriate online diagnostic test. See "Using Server Administrator Diagnostics" on page 111.
If the tests run successfully but the problem persists, see "Troubleshooting a Serial I/O Device" on page 97.

Troubleshooting a Serial I/O Device

Problem

- Device connected to the serial port is not operating properly.

Action

- 1 Turn off the system and any peripheral devices connected to the serial port.
- 2 Swap the serial interface cable with a working cable, and turn on the system and the serial device.
If the problem is resolved, replace the interface cable.
- 3 Turn off the system and the serial device, and swap the device with a comparable device.
- 4 Turn on the system and the serial device.
If the problem is resolved, replace the serial device. See "Getting Help" on page 125.
If the problem persists, see "Getting Help" on page 125.

Troubleshooting a USB Device

- 2 Turn off the system and any USB devices.
- 3 Disconnect the USB devices, and connect the malfunctioning device to the other USB connector.
- 4 Turn on the system and the reconnected device.
If the problem is resolved, the USB connector might be defective. See "Getting Help" on page 125.
- 5 If possible, swap the interface cable with a working cable.
If the problem is resolved, replace the interface cable. See "Getting Help" on page 125.
- 6 Turn off the system and the USB device, and swap the device with a comparable device.

If the problem persists, see "Getting Help" on page 125.

Troubleshooting a NIC

Problem

- NIC cannot communicate with network.

Action

- 1 Run the appropriate online diagnostic test. See "Running the System Diagnostics" on page 111.
- 2 Check the appropriate indicator on the NIC connector. See "NIC Indicator Codes" on page 16.
 - If the link indicator does not light, check all cable connections.
 - If the activity indicator does not light, the network driver files might be damaged or missing. Remove and reinstall the drivers if applicable. See the NIC documentation.
 - Change the autonegotiation setting, if possible.
 - Use another connector on the switch or hub.
- If you are using a NIC card instead of an integrated NIC, see the documentation for the NIC card.
- 3 Ensure that the appropriate drivers are installed and the protocols are bound. See the NIC documentation.
- 4 Enter the System Setup program and confirm that the NICs are enabled. See "Using the System Setup Program" on page 33.
- 5 Ensure that the NICs, hubs, and switches on the network are all set to the same data transmission speed. See the network equipment documentation.
- 6 Ensure that all network cables are of the proper type and do not exceed the maximum length. See Network Cable Requirements in your *Getting Started Guide*.

Troubleshooting a Wet System

Problem

- Liquid spilled on the system.
- Excessive humidity.

Action

 **CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Troubleshooting the System Battery

Problem

- System message indicates a problem with the battery.
- System Setup program loses system configuration information.
- System date and time do not remain current.

 **NOTE:** If the system is turned off for long periods of time (for weeks or months), the NVRAM may lose its system configuration information. This situation is caused by a defective battery.

Action

- 1 Re-enter the time and date through the System Setup program. See "Using the System Setup Program" on page 33.
- 2 Turn off the system and disconnect it from the electrical outlet for at least one hour.
- 3 Reconnect the system to the electrical outlet and turn on the system.
- 4 Enter the System Setup program.

If the date and time are not correct in the System Setup program, replace the battery. See "System Battery" on page 85.

If the problem is not resolved by replacing the battery, see "Getting Help" on page 125.

 **NOTE:** Some software may cause the system time to speed up or slow down. If the system seems to operate normally except for the time kept in the System Setup program, the problem may be caused by software rather than by a defective battery.

Troubleshooting Power Supplies

Problem

- System-status indicators are amber.
- Power-supply fault indicators are amber.
- Front-panel status LCD indicates a problem with the power supplies.

Action

 **CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

- 1 Run the appropriate online diagnostics test. See "Using Server Administrator Diagnostics" on page 111.
- 2 Locate the faulty power supply.

The power supply's fault indicator is lit. See "Power Indicator Codes" on page 15.

 **NOTICE:** You can hot-plug the power supplies. One power supply must be installed for the system to operate. The system is in the redundant mode when two power supplies are installed. Remove and install only one power supply at a time in a system that is powered on. Operating the system for extended periods of time with only one power supply installed, without a power supply blank installed, can cause the system to overheat.

Remove the faulty power supply. See "Power Supplies" on page 54.

- 3 Ensure that the power supply is properly installed by removing and reinstalling it. See "Power Supplies" on page 54.

 **NOTE:** After installing a power supply, allow several seconds for the system to recognize the power supply and to determine if it is working properly. The power indicator turns green to signify that the power supply is functioning properly. See "Power Indicator Codes" on page 15.

If the problem persists, see "Getting Help" on page 125.

Troubleshooting System Cooling Problems

Problem

- Systems management software issues a fan-related error message.

Action

Ensure that none of the following conditions exist:

- Ambient temperature is too high.
- External airflow is obstructed.
- Cables inside the system obstruct airflow.
- An individual cooling fan has failed. See "Troubleshooting a Fan" on page 101.

Troubleshooting a Fan

Problem

- System-status indicator is amber.

Running the System Diagnostics

If you experience a problem with your system, run the diagnostics before calling for technical assistance. The purpose of the diagnostics is to test your system's hardware without requiring additional equipment or risking data loss. If you are unable to fix the problem yourself, service and support personnel can use diagnostics test results to help you solve the problem.

Using Server Administrator Diagnostics

To assess a system problem, first use the online Server Administrator diagnostics. If you are unable to identify the problem, then use the system diagnostics.

To access the online diagnostics, log into the Server Administrator home page, and then click the **Diagnostics** tab. For information about using diagnostics, see the online help. For additional information, see the *Server Administrator User's Guide*.

System Diagnostics Features

The system diagnostics provides a series of menus and options for particular device groups or devices. The system diagnostics menus and options allow you to:

- Run tests individually or collectively.
- Control the sequence of tests.
- Repeat tests.
- Display, print, or save test results.
- Temporarily suspend testing if an error is detected or terminate testing when a user-defined error limit is reached.
- View help messages that briefly describe each test and its parameters.
- View status messages that inform you if tests are completed successfully.
- View error messages that inform you of problems encountered during testing.

When to Use the System Diagnostics

If a major component or device in the system does not operate properly, component failure may be indicated. As long as the microprocessor and the system's input/output devices (monitor, keyboard, and diskette drive) are functioning, you can use the system diagnostics to help identify the problem.

Running the System Diagnostics

The system diagnostics is run from the utility partition on your hard drive.

 **NOTICE:** Use the system diagnostics to test only your system. Using this program with other systems may cause invalid results or error messages. In addition, use only the program that came with your system (or an updated version of that program).

- 1 As the system boots, press **<F10>** during POST.
- 2 From the utility partition main menu, select **Run System Diagnostics**, or select **Run Memory Diagnostics** if you are troubleshooting memory.

When you start the system diagnostics, a message is displayed stating that the diagnostics are initializing. Next, the **Diagnostics** menu appears. The menu allows you to run all or specific diagnostics tests or to exit the system diagnostics.

 **NOTE:** Before you read the rest of this section, start the system diagnostics so that you can see the utility on your screen.

System Diagnostics Testing Options

Click the testing option in the Main Menu window. Table 5-1 provides a brief explanation of testing options.

Table 5-1. System Diagnostics Testing Options

Testing Option	Function
Express Test	Performs a quick check of the system. This option runs device tests that do not require user interaction. Use this option to quickly identify the source of your problem.
Extended Test	Performs a more thorough check of the system. This test can take an hour or longer.
Custom Test	Tests a particular device.
Information	Displays test results.

Using the Custom Test Options

When you select **Custom Test** in the Main Menu window, the **Customize** window appears and allows you to select the device(s) to be tested, select specific options for testing, and view the test results.

Selecting Devices for Testing

The left side of the **Customize** window lists devices that can be tested. Devices are grouped by device type or by module, depending on the option you select. Click the **(+)** next to a device or module to view its components. Click **(+)** on any component to view the tests that are available. Clicking a device, rather than its components, selects all of the components of the device for testing.

Selecting Diagnostics Options

Use the Diagnostics Options area to select how you want to test a device. You can set the following options:

- **Non-Interactive Tests Only** — When checked, runs only tests that require no user intervention.
- **Quick Tests Only** — When checked, runs only the quick tests on the device. Extended tests will not run when you select this option.
- **Show Ending Timestamp** — When checked, time stamps the test log.
- **Test Iterations** — Selects the number of times the test is run.
- **Log output file pathname** — When checked, enables you to specify where the test log file is saved.

Viewing Information and Results

The tabs in the Customize window provide information about the test and the test results. The following tabs are available:

- **Results** — Displays the test that ran and the result.
- **Errors** — Displays any errors that occurred during the test.
- **Help** — Displays information about the currently selected device, component, or test.
- **Configuration** — Displays basic configuration information about the currently selected device.
- **Parameters** — If applicable, displays parameters that you can set for the test.

Jumpers and Connectors

This section provides specific information about the system jumpers. It also provides some basic information on jumpers and switches and describes the connectors on the various boards in the system.

System Board Jumpers

Figure 6-1 shows the location of the configuration jumpers on the system board. Table 6-1 lists the jumper settings.

 **NOTE:** To access the jumpers, remove the system board cooling shroud by lifting the release latch and sliding the shroud towards the front of the system. See Figure 3-13.

 **NOTE:** Lift up the memory module airflow shroud for easy access to the jumpers.

Figure 6-1. System Board Jumpers

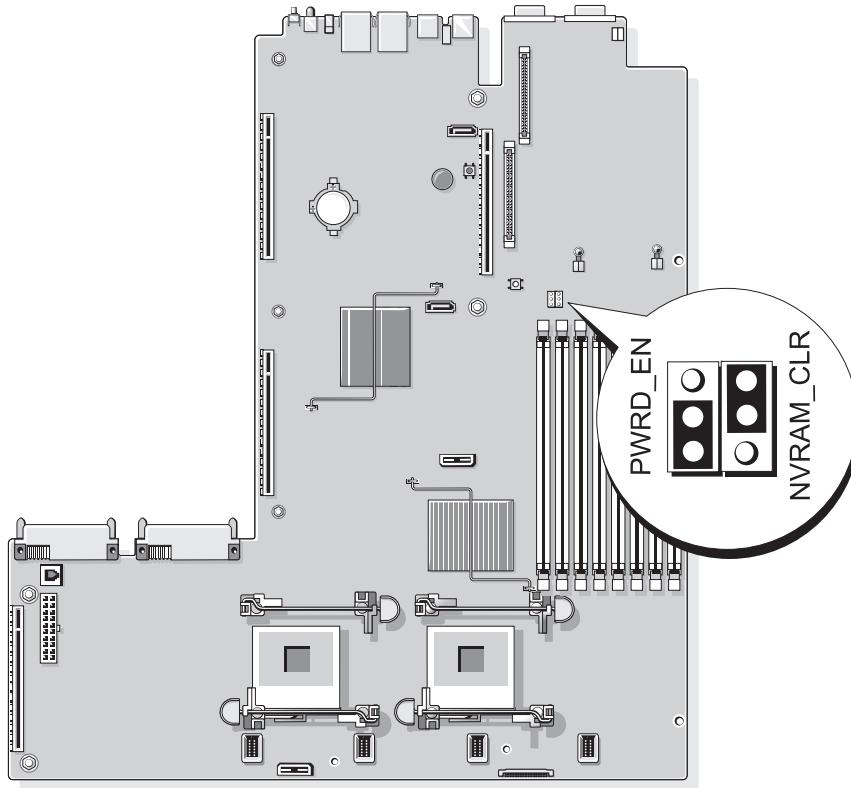

Table 6-1. System Board Jumper Settings

Jumper	Setting	Description
1 PWRD_EN		(default) The password feature is enabled.
		The password feature is disabled.
2 NVRAM_CLR		The configuration settings are retained at system boot.
		The configuration settings are cleared at the next system boot. (If the configuration settings become corrupted to the point where the system will not boot, install the jumper and boot the system. Remove the jumper before restoring the configuration information.)

NOTE: For the full name of an abbreviation or acronym used in this table, see the "Glossary" on page 147.

Disabling a Forgotten Password

The system's software security features include a system password and a setup password, which are discussed in detail in "Using the System Setup Program" on page 33. The password jumper enables these password features or disables them and clears any password(s) currently in use.

 **NOTICE:** See "Protecting Against Electrostatic Discharge" in the safety instructions in your *Product Information Guide*.

- 1 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet.
- 2 Open the system. See "Opening and Closing the System" on page 48.
- 3 Lift up the memory module shroud.
- 4 Remove the jumper plug from the password jumper.
See Figure 6-1 to locate the password jumper on the system board.
- 5 Close the system.
- 6 Reconnect your system and peripherals to their electrical outlets, and turn on the system.

The existing passwords are not disabled (erased) until the system boots with the password jumper plug removed. However, before you assign a new system and/or setup password, you must install the jumper plug.

 **NOTE:** If you assign a new system and/or setup password with the jumper plug still removed, the system disables the new password(s) the next time it boots.

- 7 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet.
- 8 Open the system. See "Opening and Closing the System" on page 48.
- 9 Install the jumper plug on the password jumper.
- 10 Lower the memory module shroud.
- 11 Close the system.
- 12 Reconnect your system and peripherals to their electrical outlets, and turn on the system.
- 13 Assign a new system and/or setup password.

To assign a new password using the System Setup program, see "Assigning a System Password" on page 40.

Expansion-Card Riser-Board Components and PCI Buses

There are two expansion card configurations for this system. Each riser (center riser and left riser) contains one slot for either a PCI-X configuration or a PCIe configuration. This system supports only one configuration (PCI-X or PCIe) for both risers. Figure 6-6 and Figure 6-7 show the components on the optional PCI-X expansion-card riser boards, including the expansion-card slots and buses. "PCIe Riser Board Expansion Slots" on page 60 and "PCI-X Riser Board Expansion Slots" on page 61 list the PCI bus and operating speed for each expansion-card slot.

 **NOTE:** Because the orientation and physical connectors are similar, the PCIe expansion card configuration is not shown.

Glossary

This section defines or identifies technical terms, abbreviations, and acronyms used in your system documents.

A — Ampere(s).

AC — Alternating current.

ACPI — Advanced Configuration and Power Interface. A standard interface for enabling the operating system to direct configuration and power management.

ambient temperature — The temperature of the area or room where the system is located.

ANSI — American National Standards Institute. The primary organization for developing technology standards in the U.S.

application — Software designed to help you perform a specific task or series of tasks. Applications run from the operating system.

ASCII — American Standard Code for Information Interchange.

asset tag — An individual code assigned to a system, usually by an administrator, for security or tracking purposes.

backup — A copy of a program or data file. As a precaution, back up your system's hard drive on a regular basis. Before making a change to the configuration of your system, back up important start-up files from your operating system.

backup battery — A battery that maintains system configuration, date, and time information in a special section of memory when the system is turned off.

BIOS — Basic input/output system. Your system's BIOS contains programs stored on a flash memory chip. The BIOS controls the following:

- Communications between the processor and peripheral devices
- Miscellaneous functions, such as system messages

bit — The smallest unit of information interpreted by your system.

blade — A module that contains a processor, memory, and a hard drive. The modules are mounted into a chassis that includes power supplies and fans.

BMC — Baseboard management controller.

boot routine — A program that clears all memory, initializes devices, and loads the operating system when you start your system. Unless the operating system fails to respond, you can reboot (also called *warm boot*) your system by pressing `<Ctrl><Alt>`. Otherwise, you must restart the system by pressing the reset button or by turning the system off and then back on.

bootable diskette — A diskette that is used to start your system if the system will not boot from the hard drive.

BTU — British thermal unit.

bus — An information pathway between the components of a system. Your system contains an expansion bus that allows the processor to communicate with controllers for the peripheral devices connected to the system. Your system also contains an address bus and a data bus for communications between the processor and RAM.

C — Celsius.

cache — A fast storage area that keeps a copy of data or instructions for quick data retrieval. When a program makes a request to a disk drive for data that is in the cache, the disk-cache utility can retrieve the data from RAM faster than from the disk drive.

CD — Compact disc. CD drives use optical technology to read data from CDs.

cm — Centimeter(s).

cmos — Complementary metal-oxide semiconductor.

component — As they relate to DMI, components include operating systems, computer systems, expansion cards, and peripherals that are compatible with DMI. Each component is made up of groups and attributes that are defined as relevant to that component.

COMn — The device names for the serial ports on your system.

control panel — The part of the system that contains indicators and controls, such as the power button and power indicator.

controller — A chip that controls the transfer of data between the processor and memory or between the processor and a peripheral.

conventional memory — The first 640 KB of RAM. Conventional memory is found in all systems. Unless they are specially designed, MS-DOS® programs are limited to running in conventional memory.

coprocessor — A chip that relieves the system's processor of specific processing tasks. A math coprocessor, for example, handles numeric processing.

CPU — Central processing unit. See *processor*.

DC — Direct current.

DDR — Double-data rate. A technology in memory modules that potentially doubles the output.
